

MNIST Handwritten Digit Recognition

Amarnath Mahadevuni

Objective

To develop a neural network model to predict the label of a handwritten digit.

Involves these steps :

- Procure data for training and testing
- Develop neural network architecture
- Train the neural network
- Test the model

Data for Training and Testing

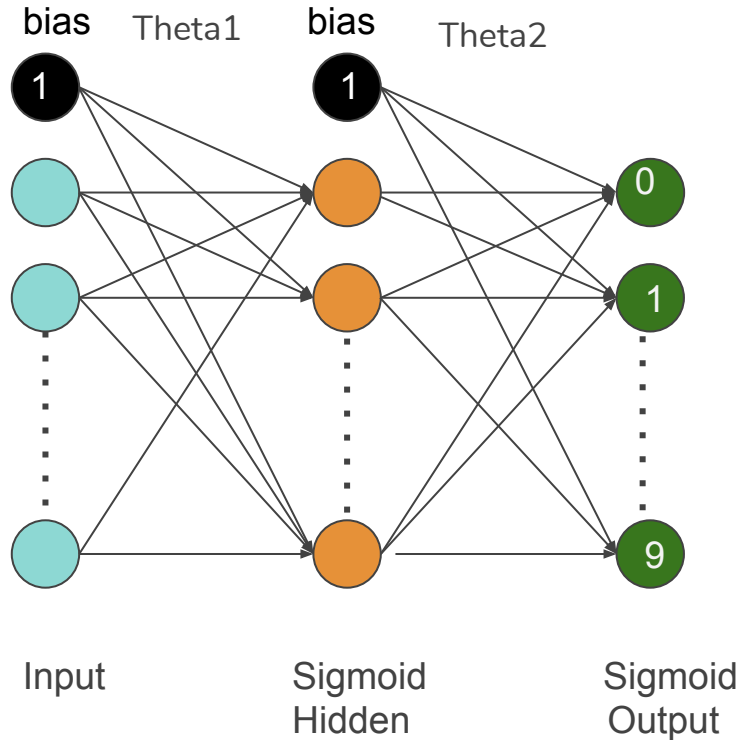

1. 5000 training examples from [Yann Le Cun MNIST repository](#)
2. Each image is a 28 pixel x 28 pixel grayscale image of a digit
3. 28x28 image is unrolled into 784-dimensional vector
4. Create training set matrix X of dimensions 5000x784
5. Each row of X is a training example.

X = input training matrix

X dimensions = (5000, 784)

Neural Network Architecture

Details:

- ❑ Input 400 units.
- ❑ Hidden layer 25 sigmoid units.
- ❑ Output 10 sigmoid units one for each digit 0-9.

Training the network

Variables:

Theta1 : Weight matrix for input-hidden layer - dimensions 25×401 ($400 + 1$ for bias)

Theta2 : Weight matrix for hidden-output layer - dimensions 10×26 ($25 + 1$ for bias)

X : Training example matrix - dimensions 5000×401

Training the network contd..

Forward Propagation :

$$A1 = X$$

$$Z2 = \text{Theta1} * \text{Transpose}(A1) \text{ (Weighted linear sum for hidden layer)}$$

$$A2 = \text{Sigmoid} (Z2) \text{ (Activation for hidden layer)}$$

$$Z3 = \text{Theta2} * \text{Transpose}(A2) \text{ (Weighted linear sum for output layer)}$$

$$A3 = \text{Sigmoid}(Z3) = \text{Output predictions for each digit}$$

$$\text{Cost function } J = \text{Sum}(-Y*\log(A3)-(1-Y)*\log(1-A3)) + (\text{lambda}*/5000)\text{Square}(\text{Theta1}) + \text{Square}(\text{Theta2})$$

lambda is regularization term

Training the network contd..

Backward propagation:

$$D3 = A3 - Y$$

$$D2 = (\text{Transpose}(\text{Theta2}) * D3) .* \text{Derivative}(\text{Sigmoid} (Z2))$$

$$\text{Delta2} = \text{Delta2} + D3 * \text{Transpose}(A2)$$

$$\text{Delta1} = \text{Delta1} + D2 * \text{Transpose}(A1)$$

$$\text{Theta1} = \text{Theta1} - \text{learning_rate} * \text{Delta1}$$

$$\text{Theta2} = \text{Theta2} - \text{learning_rate} * \text{Delta2}$$

Accuracy

An accuracy of 95% is achieved with this neural network model.
